

Baseline Flow & Gage Analysis and On-Line Tool Development Supporting Bay and Estuary Restoration in Gulf States

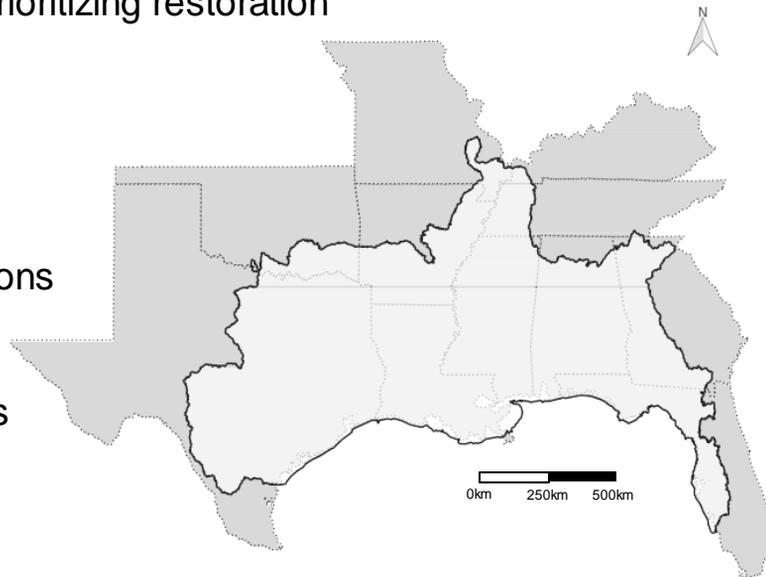

A comprehensive assessment of streamflow alteration and development of decision-support framework to facilitate restoration

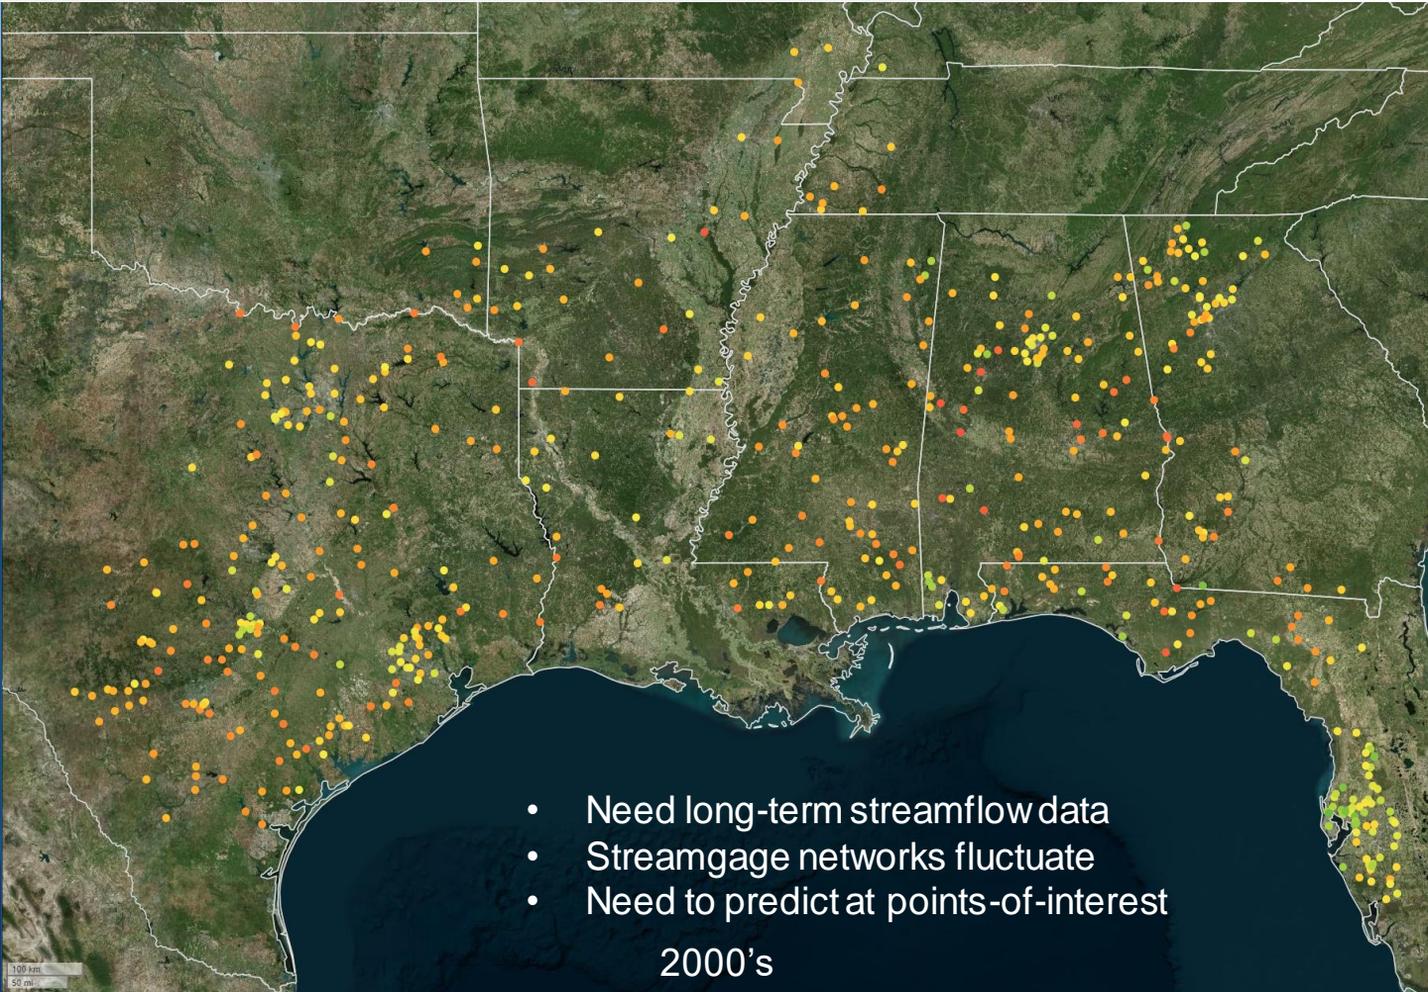

Project Objectives / Tasks

- Which streams are most altered?
- Where are there gaps in streamgaging network?
- How has streamflow delivery to the Gulf changed through time?
- Assist resource managers in prioritizing restoration

- Predictions at ungaged locations
- Trends in streamflow
- Quantify flow alteration
- Streamgaging network analysis
- Online mapping application

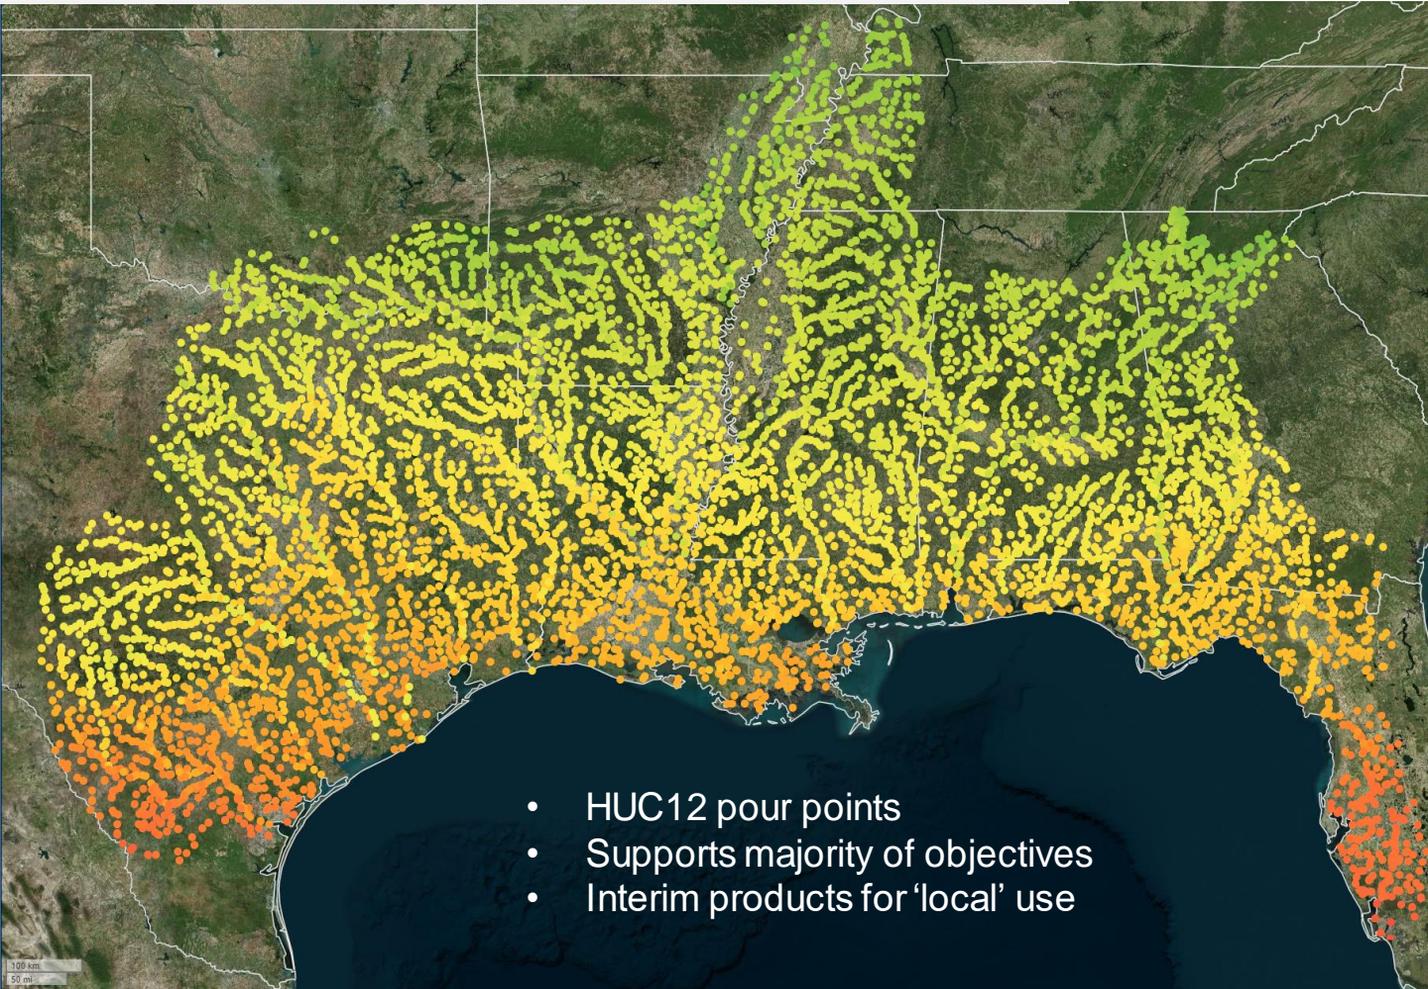

Streamgages in study area

- Need long-term streamflow data
- Streamgage networks fluctuate
- Need to predict at points-of-interest

2000's

Prediction points

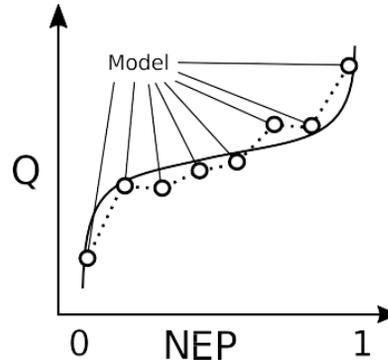

- HUC12 pour points
- Supports majority of objectives
- Interim products for 'local' use

Estimating flow-duration curves

Traditional method:

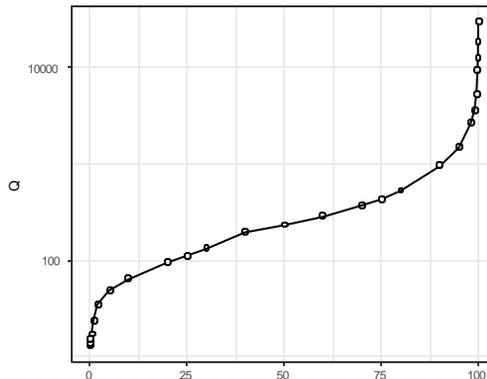

- Choose arbitrary number of quantiles
- Estimate using separate models.
- Leads to physically inconsistent FDCs.

What if we predicted each quantile simultaneously?

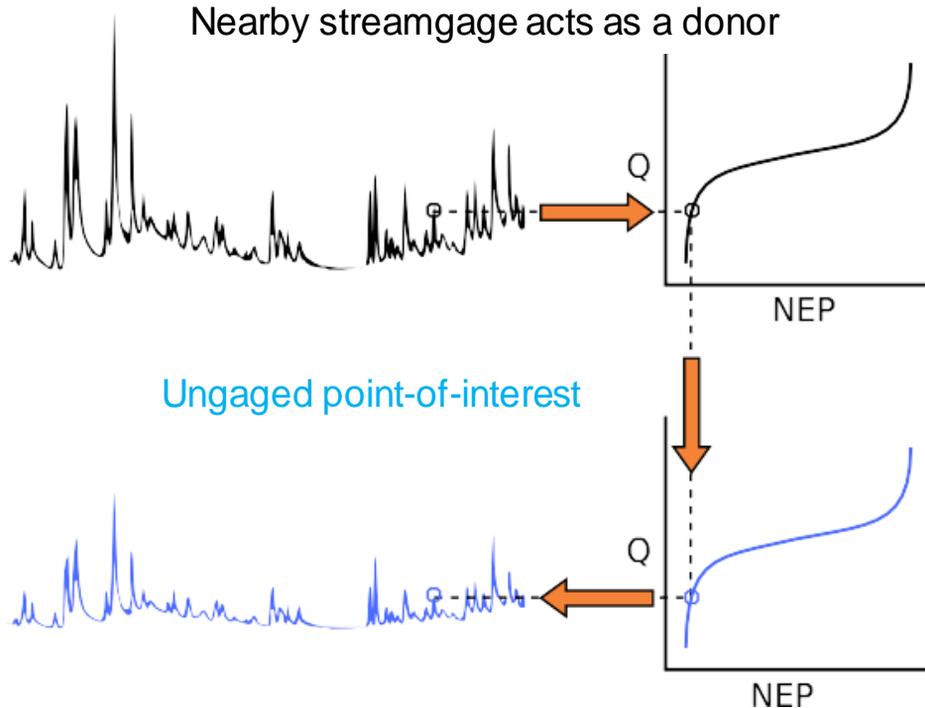

New method:

- Multioutput neural networks
- Simultaneous quantile prediction
- Greater likelihood of physically consistent FDCs

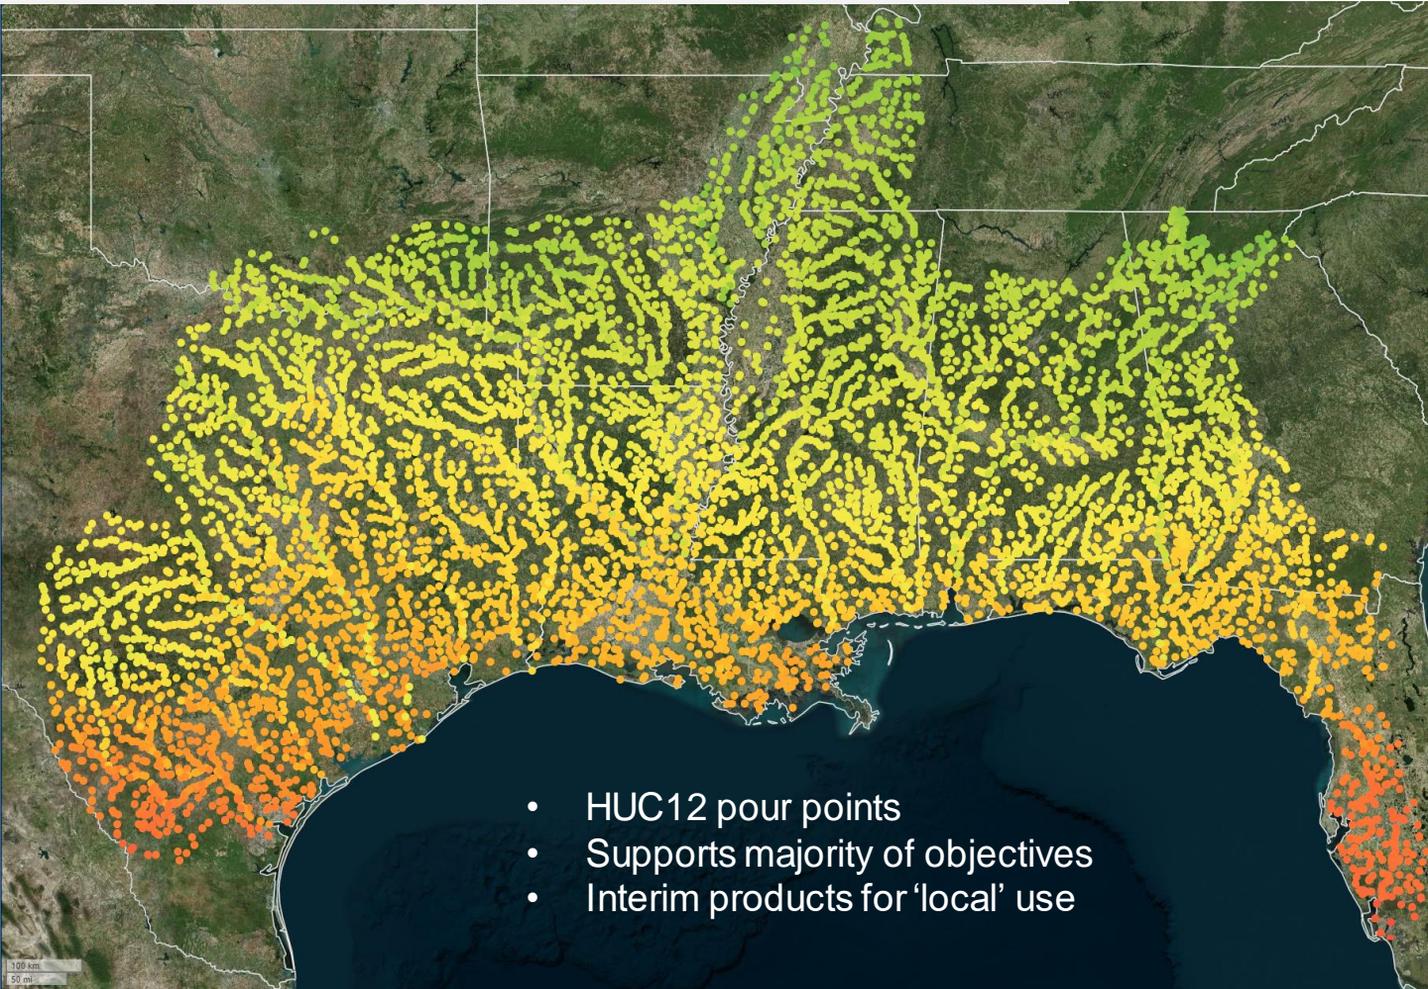

Worland, SC, Steinschneider, S, Asquith, WA, Knight RR, and Wiczorek, M. 2019. Prediction and inference of flow-duration curves using multi-output neural networks. *Water Resources Research*, accepted.

Developing streamflow time series

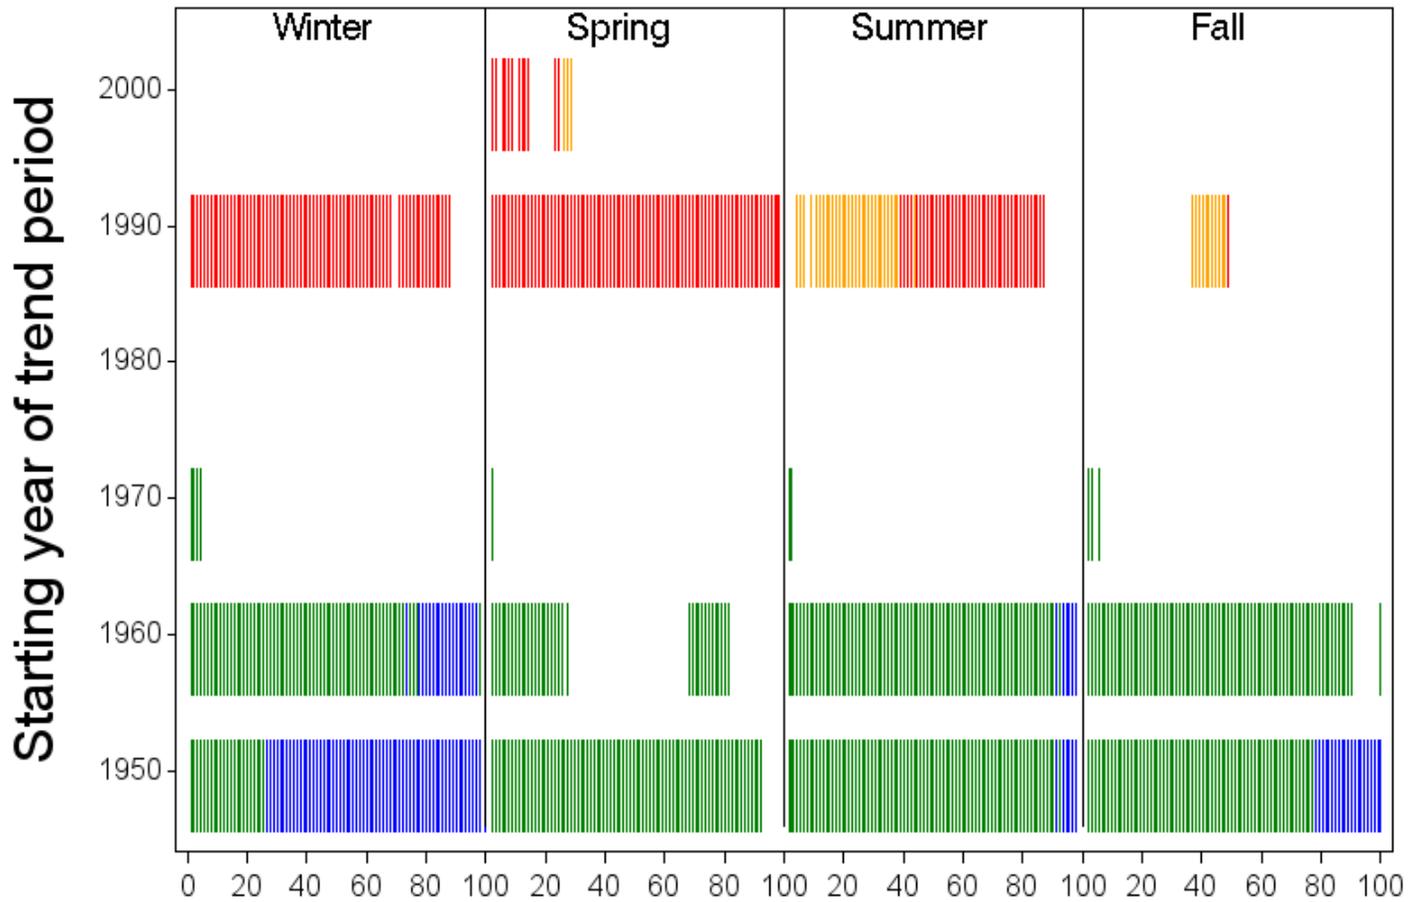

Worland, SC, Steinschneider, S, Asquith, WA, Farmer, WH, and Knight RR. 2019. Copula theory as a generalized framework for flow-duration curve based streamflow estimates in ungauged catchments. *Water Resources Research*, bureau approved.

Prediction points

- HUC12 pour points
- Supports majority of objectives
- Interim products for 'local' use

Trend results stratified by season

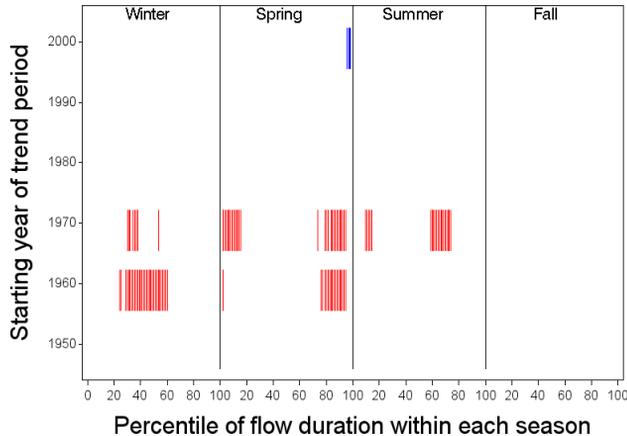

Percentile of flow duration within each season

Streamflow Alteration – Trends Disturbance Index

Suwannee River at White Springs, FL

0 Trends for POR 1950-2015

Site no. 12, HDI=16

Reference Site

Calculation for Withlacoochee River near

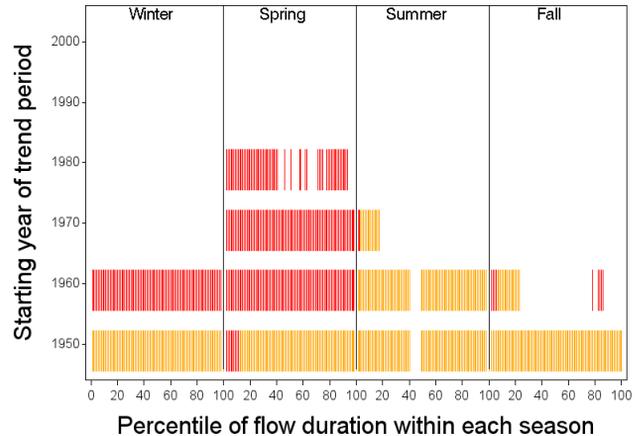

Holder, FL 1950-2015:

$$255/365 = .70$$

Withlacoochee River near Holder, FL

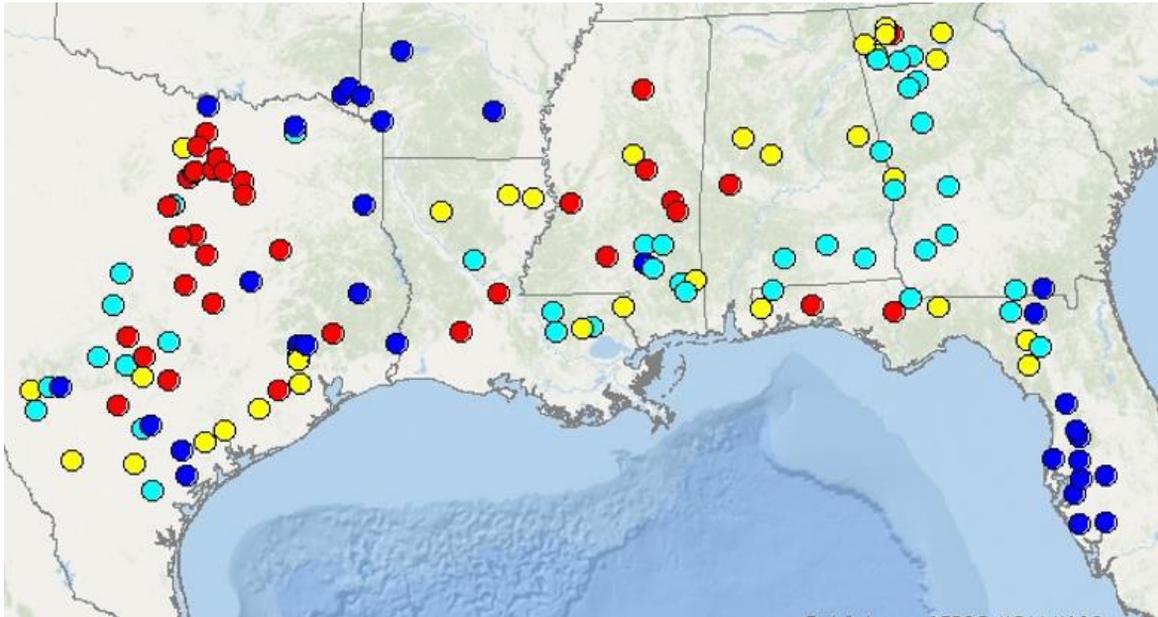

255 Significant Trends for POR 1950-2015

Site no. 10, HDI=25

Data are provisional and subject to revision until they have been thoroughly reviewed and received final approval.

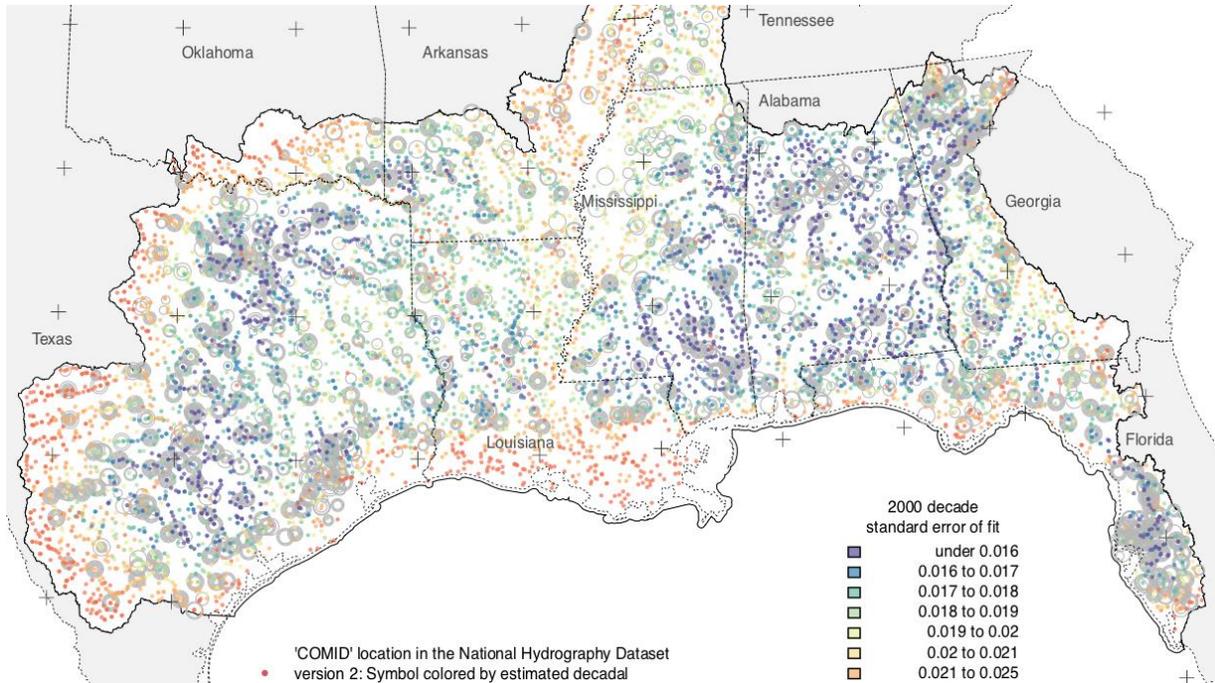

Streamflow Alteration – Trends Disturbance Index

- 0 - .22: Least Disturbed
- .23 - .44: Low to Moderate Disturbance
- .45 - .66: Moderate to High Disturbance
- .67 - 1.0: Most Disturbed

Data are provisional and subject to revision until they have been thoroughly reviewed and received final approval.

Network Analysis using Model Divergence

- Analysis of prediction error will be used to identify gaging needs
- Warmer colors → areas that need more streamgaging (under-represented)
- Use network analysis to guide streamgaging placement in phase 2

VARIABLE: Base flow index (%)

Colors

- Filter and visualize sites based on similar characteristics
- Identify sites that may have similar flow regimes

RESTORE - Streamflow alteration assessments to support bay and estuary restoration in the Gulf States

[View ▾](#)

Summary

Human alteration of waterways has impacted the minimum and maximum streamflows in more than 86% of monitored streams nationally and may be the primary cause for ecological impairment in river and stream ecosystems. Restoration of freshwater inflows can positively affect shellfish, fisheries, habitat, and water quality in streams, rivers, and estuaries. Increasingly, state and local decision-makers and federal agencies are turning their attention to the restoration of flows as part of a holistic approach to restoring water quality and habitat and to protecting and replenishing living coastal and marine resources and the livelihoods that depend on them. Personnel in the Lower Mississippi-Gulf Water Science Center have been working to quantify and map streamflow alteration to support streamflow and estuary restoration along the Gulf Coast.
